General conditions for measurements

Test condition parameter:	The state of the state of
Air speed close to the UUT:	≤0.5m/s
Ambient temperature:	20°C±5°C
Relative Humidity:	10-80%
Test voltage and frequency:	☐ 115V±1%/60Hz±1% ☐ 5.0 V DC for products drawing power from a computer USB port ☐ the midpoint of the rated input voltage range for all other products (only on DC input voltage)
THD of the input voltage (for AC input voltage):	≤ 2 % (up to and including the 13th harmonic)
Crest factor of input voltage (for AC input voltage):	1.34 – 1.49
AC ripple voltage (RMS) (for DC input voltage):	≤ 0.2 V for DC voltages up to 10 V; or ≤ 2 % of the DC voltage for DC voltages over 10 V
Power measurement accuracy:	≤2% (power≥0.5W) ≤0.01W (power<0.5W)

Remark:

- 1. When determining for test conclusion, measurement uncertainty of tests has been considered.
- 2. Measurements of power of 0.50 W or greater was made with an uncertainty of less than or equal to 2 % at the 95 % confidence level.
- 3. Measurements of power of less than 0.50 W was made with an uncertainty of less than or equal to 0.01 W at the 95 % confidence level.
- 4. The power measurement instrument shall, as applicable, have a resolution of:
- (1) 0.01 W or better for measurements up to 10 W;
- (2) 0.1 W or better for measurements of 10 to 100 W; or
- (3) 1 W or better for measurements over 100 W.

Manufacturer of battery:	GREAT POWER CO LTD.
Model of battery:	ICR18650 2200mAh
Nameplate battery voltage:	3.7V
Nameplate battery capacity:	2200mAh
Nameplate Battery Energy Capacity:	16.28Wh
Number of batteries incorporated in the product:	2
Note: Two batteries were in parallel into one for 4400n	nAh to testing.

Testing Setup

Reference No.: WTD19D08053608N

Charge the battery with the UUT for the period specified by the UUT manufacturer as the time needed to fully charge the battery under test.

- 1) All limited time functions used to deliver the primary charge to the battery, including cell equalization, are to be excluded from the measurement of battery maintenance mode.
- 2) If these events are known to occur for a time period beyond the manufacturer specified charge time, the battery is to be left in place until all such functions are complete.
- 3) In cases where no charge time is specified, the batteries to be charged for a period of at least 24 hours.

Unit Energy Consumption requirement

Unit energy consumption (UEC) less than or equal to the prescribed "Maximum UEC" standard when using the equations for the appropriate product class and corresponding rated battery energy as shown in the following table:

TABLE 3.3.3—BATTERY CHARGER USAGE PROFILES

	Product class			Hours per day***			Charges (n)	Threshold charge time*
Number	Description	Rated battery energy (ebatt)**	Special characteristic or battery voltage	Active + maintenance (t _{a&m})	Standby (t _{sb})	Off (t _{off})	Number per day	Hours

^{*}If the duration of the charge test (minus 5 hours) as determined in section 3.3.2 of appendix Y to subpart B of this part exceeds the threshold charge time, use equation (ii) to calculate UEC otherwise use equation (i).

^{**}E_{batt} = Rated battery energy as determined in 10 CFR part 429.39(a).

^{***}If the total time does not sum to 24 hours per day, the remaining time is allocated to unplugged time, which means there is 0 power consumption and no changes to the UEC calculation needed.

^{****}Inductive connection and designed for use in a wet environment (e.g. electric toothbrushes).

Unit Energy Consumption Result:

Calculate unit energy consumption (UEC) for a battery charger using one of the two equations (equation (i) or equation (ii)) listed below. If a battery charger is tested and its charge duration as determined in section 5.2 of this appendix minus 5 hours is greater than the threshold charge time listed in table 5.3 below (i.e. (tcd-5) * n > ta&m), use equation (ii) to calculate UEC; otherwise calculate the battery charger's UEC using

6	Low-Energy, High-Voltage Medium-Energy, Low-Voltage Medium-Energy, High-Voltage High-Energy	0.0778 * E _{batt} + 2.4.

Department of Energy (DOE) sampling plan for Battery chargers

Determination of represented value. Manufacturers must determine represented values, which include certified ratings, for each basic model of battery charger in accordance with the following sampling provisions.

Represented values include: The unit energy consumption (UEC) in kilowatt-hours per year (kWh/yr), battery discharge energy (Ebatt) in watt hours (Wh), 24-hour energy consumption (E24) in watt hours (Wh), maintenance mode power (Pm) in watts (W), standby mode power (Psb) in watts (W), off mode power (Poff) in watts (W), and duration of the charge and maintenance mode test (tcd) in hours (hrs) for all battery chargers other than uninterruptible power supplies (UPSs); and average load adjusted efficiency (Effavg) for UPSs.
